Design for Our Future Selves Workshop

So Much Gratitude to Those Who Laid the Path Before Me

This project couldn't be made possible without many wonderful resouces. Special thank you to Heather Synder Quinn + Ayako Takase,for the extremely helpful **Matriarchal Design Futures Workbook** – which inspired + guided many of these activities today.

To T. Hancock & C. Bezold, for the **Futures Cone** graph – from 'Possible Futures, Preferable Futures', Healthcare Forum Journal

To Lexi Namer + Kate Every with the **Ethical Designer website** – for making me realize I don't need to reinvent good tools – I just need a platform to share them.

To the **People's Design Archive** for starting a shared crowd-sourced platform that inspired me.

Ashton Applewhite, Ryan Backer, and Kyrie Carpenter at **Old School.**

The Royal College of Art + Design, **Design Age Insitute**

Mismatch: How Inclusion Shapes Design by Kat Holmes

Radical Inclusion by David Moinina Sengeh

Ageism Unmasked: Exploring Age Bias and How to End it by Tracey Gendron

This Chair Rocks: A Manifesto Against Ageism by Ashton Applewhite

And last, but certainly not least:

The financial support from the **School of Design** and **The College of Architecture + Design** at the **University of Tennessee Knoxville,** specifically funding from the **James Johnson Dudley Fellowship** and the **Alma and Hal Reagan Research Award.**

A WORKSHOP LED BY KIMBERLY MITCHELL

GOALS OF WORKSHOP

through presentation/website

Understand the Impact of Age Bias in Design: Explore how age bias influences the design of products, services, and experiences for older adults, and learn how to shift toward more inclusive design approaches.

Recognize Age-Related Changes: Gain a deeper understanding of the physical, cognitive, social, and emotional changes that occur as people age and how these changes should influence design decisions.

in small groups

Explore Future Possibilities: Use the Futures Cone to envision possible, probable, and preferred futures for designing better products and systems for aging populations.

Design and Evaluate Holistically with the 6Ms of Care: Use a custom evaluation framework inspired by the Hamlyn Cloverleaf and the Royal College of Art's Age-Inclusive Design Evaluation Tool. The 6Ms—What Matters, Mobility, Meaningful Activities, Medication, Mealtime, and Make Comfortable—will guide you in designing solutions that consider the full experience of aging, and help you assess how well your ideas support independence, dignity, comfort, and connection.

Collaborate and Share Insights: Work in small groups to generate solutions and ideas, then come together as a group to share results and foster discussion on how to improve design for aging.

1
Understanding Age Bias in Design

Age bias is one of the most overlooked forms of bias in design. While conversations around race, gender, and disability in design are slowly gaining traction, age often remains invisible—until it's too late. The assumption that older adults are out of touch, resistant to change, or no longer relevant shows up in everything from tech products to healthcare signage, transportation systems to fashion campaigns.

This kind of bias isn't always malicious—**it's often unintentional.** It's in the default font sizes that are too small to read. The forms that time out too quickly. The flat surfaces that are hard to grip. It's in the way we design for "young, active users" and call everything else "senior-friendly," as if aging is an edge case instead of a universal experience.

Designing with age bias often means designing **for** older adults instead of **with** them. It flattens the complexity of later life into one-note stereotypes like **frailty, confusion, irrelevance—while ignoring the diversity of abilities, interests, and lifestyles that exist at every age.** Worse, age bias often intersects with other forms of discrimination, compounding exclusion for older adults who are also disabled, queer, BIPOC, low-income, or non-English-speaking.

We see the impact of this bias in everyday design:

When digital check-ins at a doctor's office don't account for cognitive or visual changes

When products marketed to older adults prioritize function over dignity

When public spaces are designed without places to rest, even as the population of older adults grows

When marketing excludes older faces entirely—or depicts them only as either helpless or heroic

But design can do better. We must do better.

When we name age bias, we create space to unlearn it. We begin to ask:

Who is being left out of this design decision? What assumptions am I making about aging? And what might change if we designed as if we were the ones aging—because, in truth, we are.

While co-design with older adults is one of the most powerful ways to challenge age bias and build meaningful, inclusive solutions, it isn't always possible. Time, resources, and logistics don't always allow for direct collaboration.

That's where this workshop comes in. It is not a substitute for co-design, but it is a starting point.

A way to pause, reflect, and ask ourselves: What kind of world do I want to grow older in?

Because the truth is, aging isn't someone else's experience, it's ours, just in a future moment.

This workshop is about waking up to that future.

It's about recognizing that we each have the power to disrupt what already exists and imagine something better. A world where aging doesn't mean invisibility. A world where accessibility and joy are built into the fabric of everyday life. You don't have to wait until you're older to care about these things. **You can design now, for your future self and for others. Let this be the beginning of that change.**

2

Recognizing Age-Related Changes

Aging is a multidimensional experience. Designing for age should begin with empathy. As we age, changes occur across our senses, bodies, minds, and social environments. Understanding these changes grounded in research helps us create products and systems that honor the lived experience of aging while supporting independence, dignity, and joy.

Vision: By age 60, we typically need three times more light to see than at age 20. Contrast sensitivity declines, and glare becomes more disruptive. Nearly 1 in 3 adults over 65 experiences some form of visual impairment.[1]

Hearing: About one-third of adults over 65 have some level of hearing loss, most often in high-frequency ranges. This can make speech hard to follow, especially in noisy spaces.[2]

Touch & Fine Motor Skills: Tactile sensitivity declines, making it harder to detect texture or temperature. Grip strength and hand dexterity may weaken, making tasks like opening packaging or using small devices more difficult.[3]

Taste & Smell: As taste buds decrease and olfactory sensitivity fades, food may become less enjoyable or recognizable—affecting nutrition, safety, and quality of life.[4]

Mobility & Balance: Nearly 40% of adults over 65 experience some form of disability, with mobility being the most common. Balance issues, joint stiffness, and muscle weakness may affect walking, standing, or using stairs.[5]

Reaction Time: Response times tend to slow with age, which can affect safety while driving or navigating fast-paced environments.[6]

Cognition & Spatial Awareness: While short-term memory and processing speed may decline, older adults often retain strong reasoning skills, vocabulary, and problem-solving abilities. Changes in spatial memory and orientation can also make unfamiliar environments harder to navigate—especially when visual cues and signage are unclear. About 1 in 9 adults over 65 lives with Alzheimer's or another form of dementia.[7]

While it's essential to understand these age-related changes and account for them in our design decisions, that knowledge alone isn't enough.

We're not just designing for physical needs—we're designing for people. People who want to feel included, connected, stimulated, and seen.

Older adults are not defined by their limitations—they're curious, creative, and full of life. That means the things we design shouldn't just be functional or accessible; they should also be joyful to use.

Whether it's a product, a space, or a system, good design should invite participation, not just accommodation. **Empathy means asking not only, "Can someone use this?," but also, "Will they want to?"**

Despite the age-related changes listed on the previous page, aging also brings strengths and resilience. Research shows that emotional regulation often improves with age—older adults are more likely to experience contentment, manage stress well, and prioritize positive relationships.

Technology adoption is also increasing: in 2021, 75% of adults aged 65+ were online, and more than 60% owned a smartphone. However, confidence and usability remain critical—many older adults cite poorly designed interfaces or fear of making a mistake as barriers to engagement.[8]

3

Where to Learn More

The Design for Aging Resources website a curated and comprehensive resource hub dedicated to showcasing some of the best resources for designing with and for older adults in mind.

This platform is built for designers, educators, and professionals who are passionate about creating inclusive, thoughtful, and joyful experiences that address the needs of our aging population.

You'll find a wide array of toolkits, videos, podcasts, books,programs, and organizations that provide valuable insights into the design challenges and opportunities that come with an aging world. Whether you're an emerging designer, an educator guiding the next generation, or an industry professional looking to refine your approach, this website offers the knowledge and tools to help you design with older adults at the core.

The curated collection features practical resources and inspirational case studies that emphasize the importance of empathy, inclusion, and foresight in the design process.

From accessibility guidelines to co-design methodologies, each resource is selected to empower you to create meaningful and engaging solutions for older adults — solutions that contribute to a more inclusive and joyful world for people of all ages.

Visit the website
designforagingresources.com

Let's shift the narrative from decline to opportunity—creating inclusive, empowering experiences where we all belong.

Now that you've had a chance to explore how our bodies, minds, and relationships shift with age, take a moment to turn inward.

You've likely seen aging up close—maybe in a parent, a neighbor, a client, or even in yourself. Maybe you've noticed a slower gait, a need for brighter light, a growing reliance on technology—or a growing frustration with it. Maybe you've seen isolation take hold, or wisdom shine through. Whatever your experience, aging is not theoretical. It's personal. It's inevitable. And it's also full of potential.

So let's pause here and ask a bigger question:

What kind of world do you want to grow older in?

A world where it's easy to stay connected, even when mobility or memory changes?

A world where caregiving doesn't mean sacrifice?

A world where technology meets you with ease, not exclusion?

A world where joy, creativity, and freedom don't have an expiration date?

WORKSHOP

Part One

DESIGN
FOR
CARE LAB

TENNESSEE SCHOOL OF DESIGN

Before we begin designing that future, we'll start by reflecting on the present.

Each of you has been assigned a topic—health, mobility + transportation, entertainment + connection, or caregiving. Start by writing down what's on your mind when you think about that topic and aging.

What worries you?
What excites you?
What feels broken—and what gives you hope?

Don't overthink it.

Just write down the thoughts that come on the provided sticky notes. Put only one thought per sticky note.

Your reflections—your fears, your hopes, your lived experience—will be the foundation for the design work ahead. This is where we start to shift the narrative.

Not just asking how can we fix aging, but instead asking, how can we design a future we actually want to grow into?

Now that you've named what's on your mind—your fears, your hopes, your frustrations, your dreams—it's time to begin organizing those thoughts.

On the next page is a radar diagram. Think of it like a map of your priorities. The center represents what matters most to you when you think about aging and your assigned topic. The farther out you place a post-it, the less personally important or urgent it feels—at least right now.

Take a few minutes to review the things you wrote down. Then on your own, begin placing each one on the radar:

1. Place your top priorities—the things that feel most meaningful or in need of change—closest to the center.

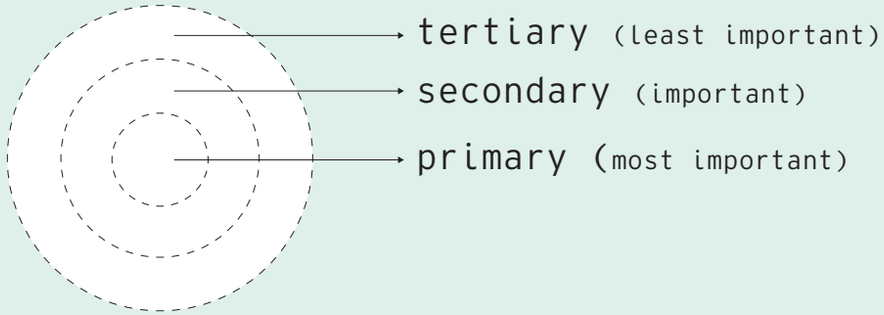
2. Place things that matter but feel less immediate or important farther out.

Don't worry about getting it perfect. This is a snapshot of how you feel today. It might change tomorrow—and that's okay.

You might find your most pressing hopes and fears are closer than you thought. Or you might realize that something you hadn't considered before belongs right in the center. Use this moment to reflect, question, and start shaping what a better future could look like—for yourself and for others.

Once everyone is done, we'll move into imagining what's possible—because every great design starts with paying attention to what matters.

WHAT'S ON YOUR RADAR?

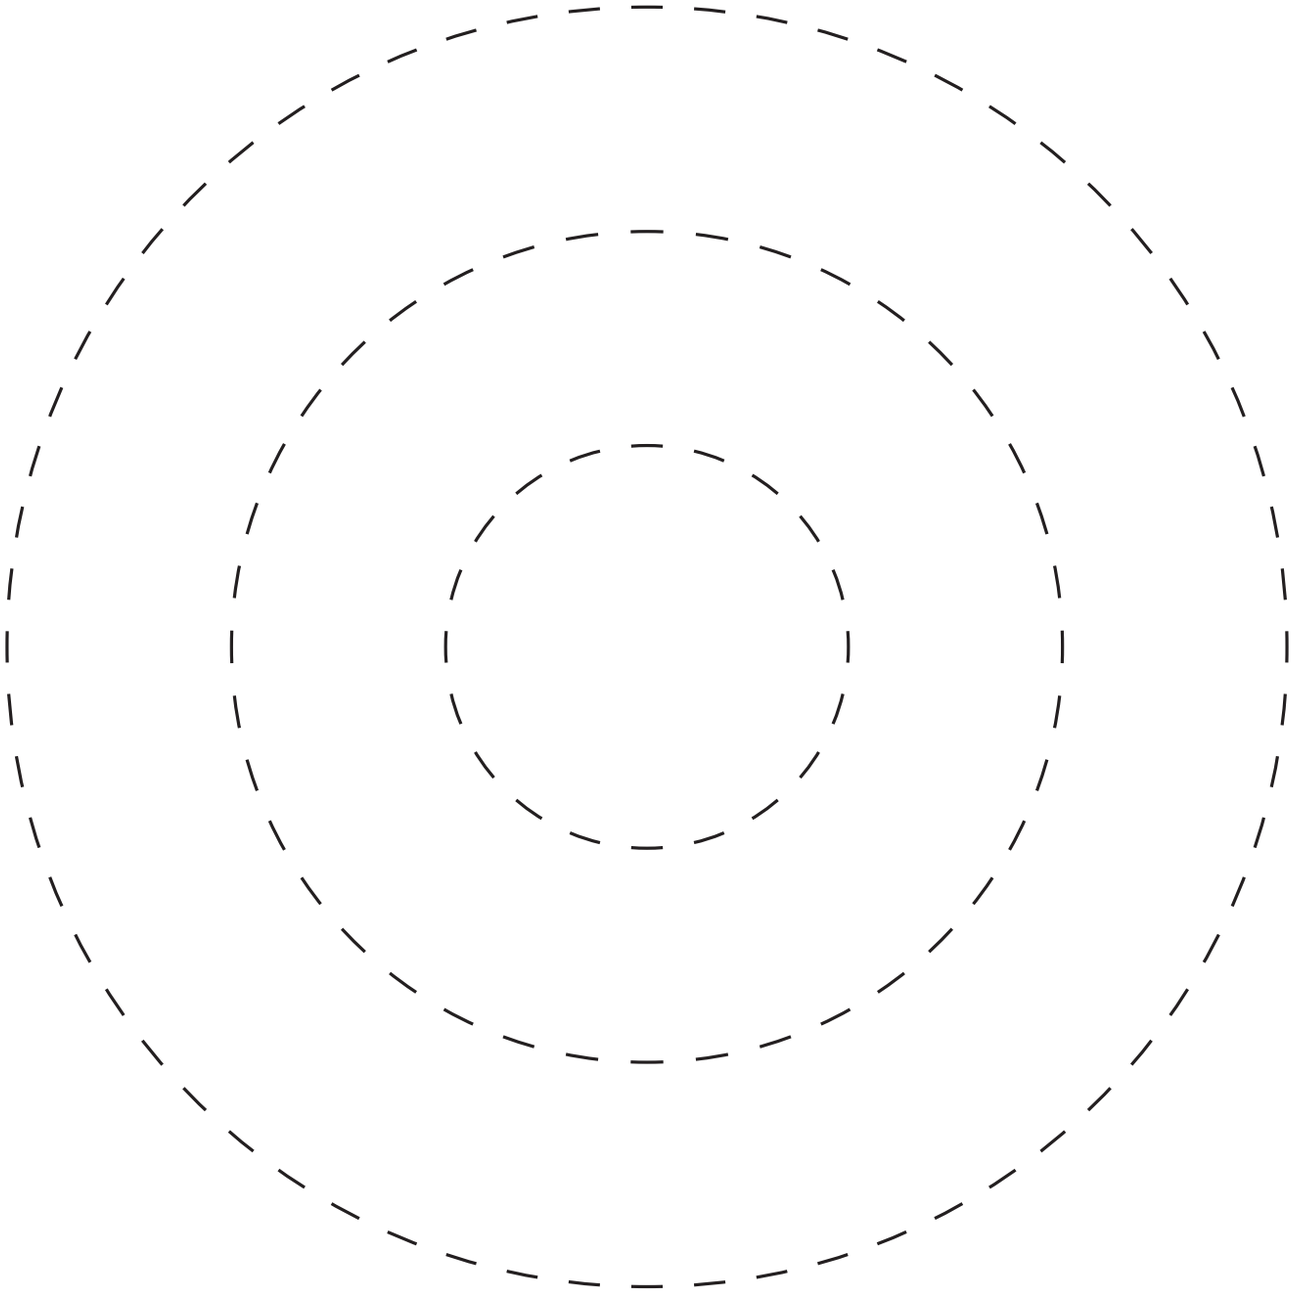


The Radar Exercise allows us to to identify and prioritize the key topics, challenges, or opportunities related to your theme.

You will start by writing your own ideas on sticky notes and then place them on the radar based on their importance.

This exercise helps us organize our thoughts and figure out which areas need the most attention when it comes to designing for older adults. Once we've identified our key priorities, we'll use these as a foundation for the rest of the workshop.

What's On Your Radar?



WORKSHOP

Part Two

DESIGN
FOR
CARE LAB

TENNESSEE SCHOOL OF DESIGN

Now get together with others with the same theme.

As a team, take a few minutes to share your individual radars.

Talk about what you placed in the center and why.

What patterns are emerging?

Are there shared priorities—or surprising differences?

Are there things someone put on the edges that feel urgent to someone else?

This part is about listening. About seeing aging—and your topic—through each other's eyes.

Once you've discussed your radars, work together to identify the areas that feel most important to your group.

1. Choose your top three priority areas—these are the ideas, problems, or opportunities you'd most like to focus on in the next activity.

2. Then, take a look at the ideas that landed farther from the center. Are there three that felt less important—but that might be undervalued or overlooked in everyday design? Select three of those "least important" areas too. Sometimes what we ignore tells us just as much as what we prioritize.

You'll take all six of these—your top three and bottom three—and carry them into the next part of the workshop, where we'll use them to imagine new futures.

Think of this moment as your team planting the seeds. What you choose here will grow into the ideas and designs you'll build together.

From The Radar

TOP THREE

BOTTOM THREE

WORKSHOP

Part Three

DESIGN
FOR
CARE LAB

TENNESSEE SCHOOL OF DESIGN

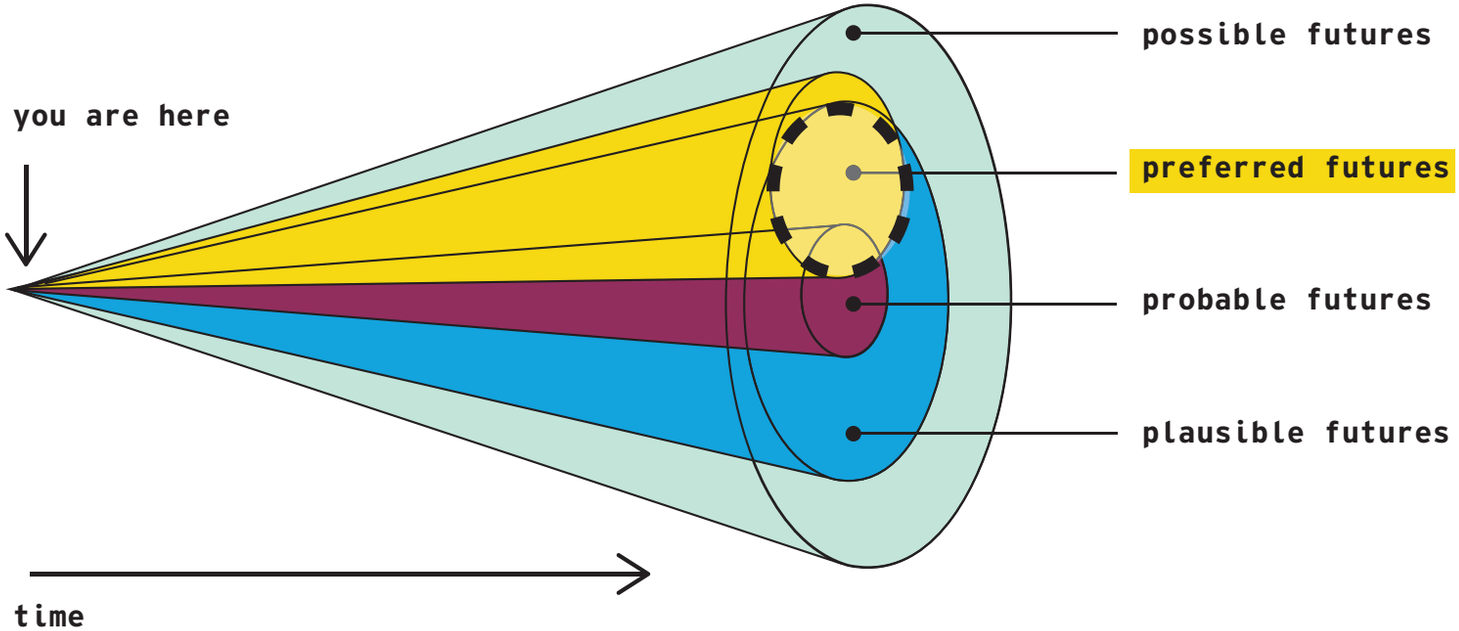
Now that we've identified our key priorities from the radar activity, we're going to use a tool called the Futures Cone to think about how these priorities might evolve over time. The Futures Cone helps us imagine four different types of futures.

As we move through this activity, participants should to think about the future of their theme —whether it's health and wellbeing, transportation and mobility, entertainment and social connectedness, or caregiving and relationships.

What might happen in the future, and what do we want to see happen?

As you move forward, imagine the products, services, systems, or experiences that could support that future. What would help you live the life you want? What design interventions might support others navigating similar challenges or joys? Nothing is off-limits—think big, think bold.

The Cone of Possibilities

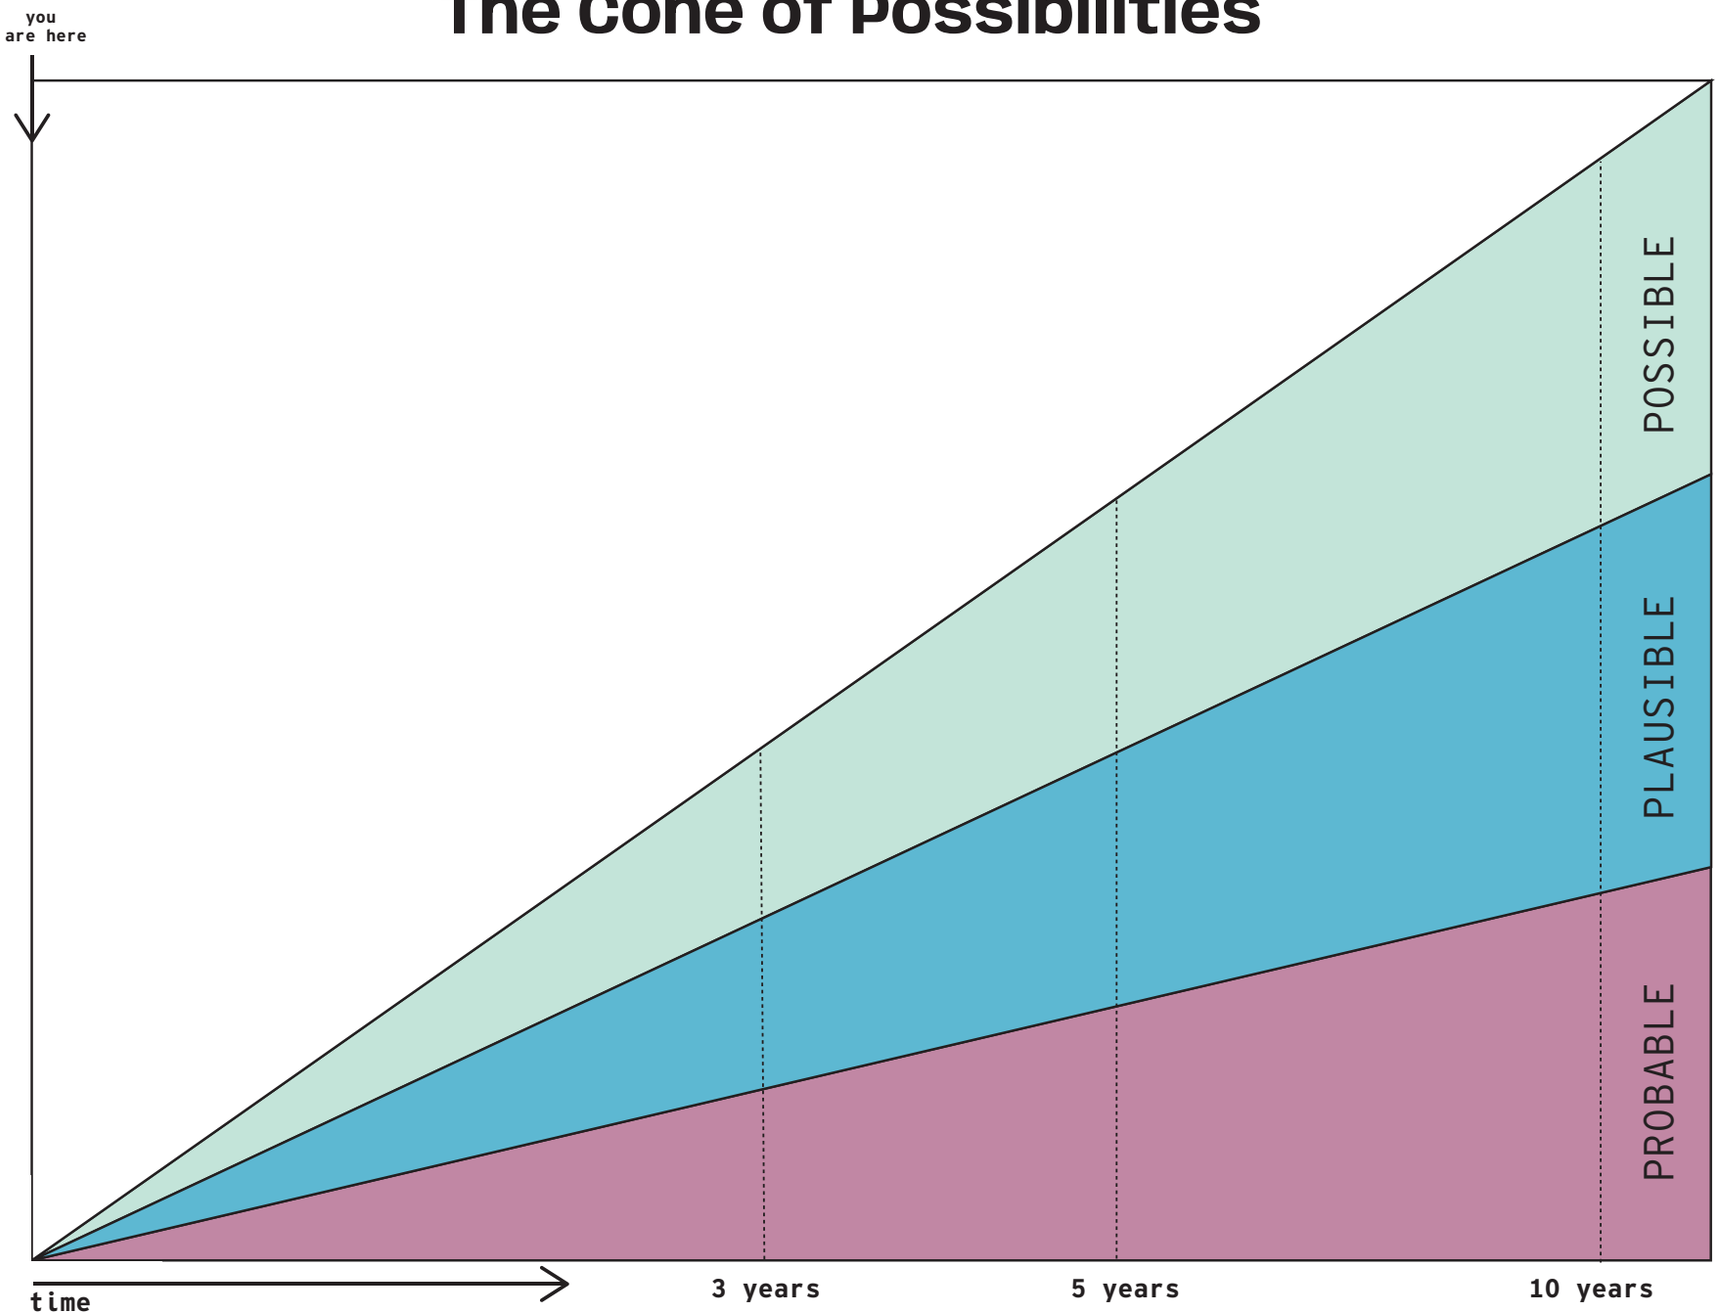


DEFINITIONS:
Probable Futures: These are the futures most likely to occur if current trends continue without significant disruption. They are an extension of today's reality.

Plausible Futures: These are futures that could reasonably happen based on current trends and what we know today. They're grounded in reality but still push the boundaries of current design.

Possible Futures: These are all the futures that could happen. They might involve radical changes or new technologies that don't exist yet.

The Cone of Possibilities



WORKSHOP

Part Four

DESIGN
FOR
CARE LAB

TENNESSEE
SCHOOL OF DESIGN

Stop.

Your group must meet with the workshop facilitator to continue moving forward.

Uh-oh. Life just threw a curveball.

You never know what life has in store for us, and that's the reality of designing for our future selves.

Just like in real life, unexpected events happen: a new diagnosis, a major shift, something you didn't plan for.

The facilitator has tossed you a surprise, and now it's time to adapt.

But here's the thing—futures thinking isn't just about imagining ideal worlds; it's also about building resilient ones.

At this stage, we're focusing only on preferred futures—what you want your future to look like, even in the face of change.

Revisit what your group just designed. **How might this new challenge shift your approach? What would need to be redesigned, rethought, or reinvented to support the life you still want?**

Think of it in terms of time:

What can be done now?

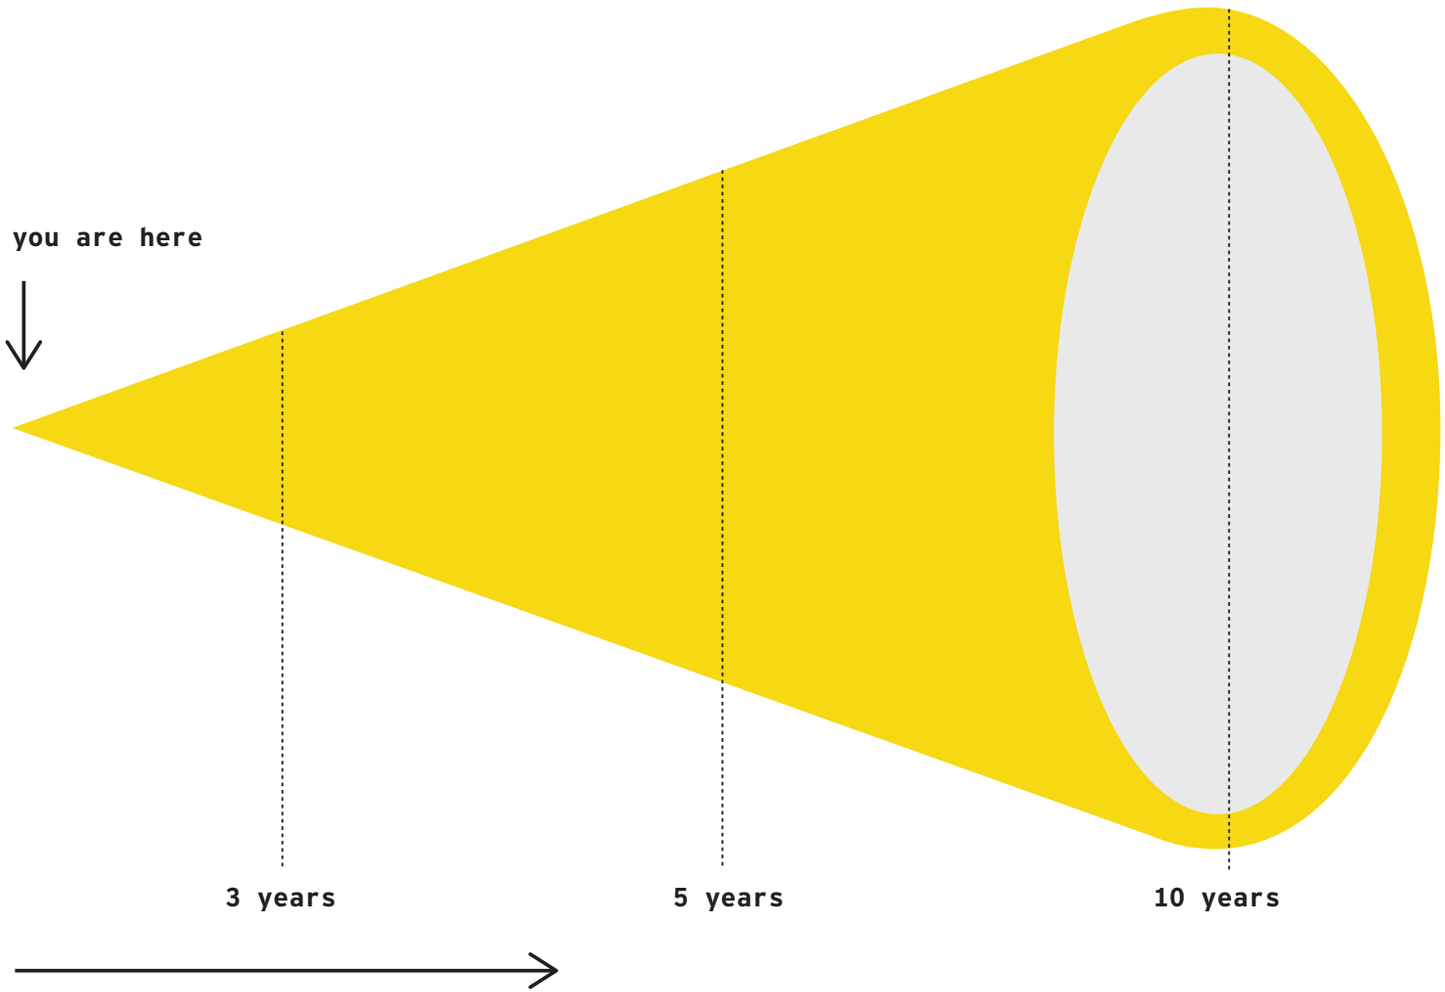
What might be possible in five years?

In ten?

Use this moment to stretch your ideas—design something beautiful, meaningful, and supportive for the path ahead.

This is about designing through the challenges, not around them.

Preferred Future



WORKSHOP

Part Five

DESIGN
FOR
CARE LAB

TENNESSEE SCHOOL OF DESIGN

A Tool to Measure

Tool-Build in Progress – Feedback Welcomed

The 4Ms of Care come from the Age-Friendly Health Systems initiative and are used in healthcare to improve outcomes for older adults. This framework focuses on what matters most to people as they age by addressing four key areas: What Matters, Medication. Mentation and Mobility.

Recognizing that care goes beyond clinical needs, Dr. Ruth Palan Lopez expanded the framework to include two additional areas based on real-world caregiving experiences: Meal time + What Matters, and changed Mentation to Meaningful Activities. Together, the 6Ms of Care offer a more holistic, human-centered lens that helps us design not just for health systems, but for the full reality of aging and daily life.

Using a custom evaluation framework inspired by the **Hamlyn Cloverleaf** and the Royal College of Art's **Age-Inclusive Design Evaluation Tool**, the **6Ms of Care Framework** can guide you in designing solutions that consider the full experience of aging, and help you assess how well your ideas support independence, dignity, comfort, and connection.

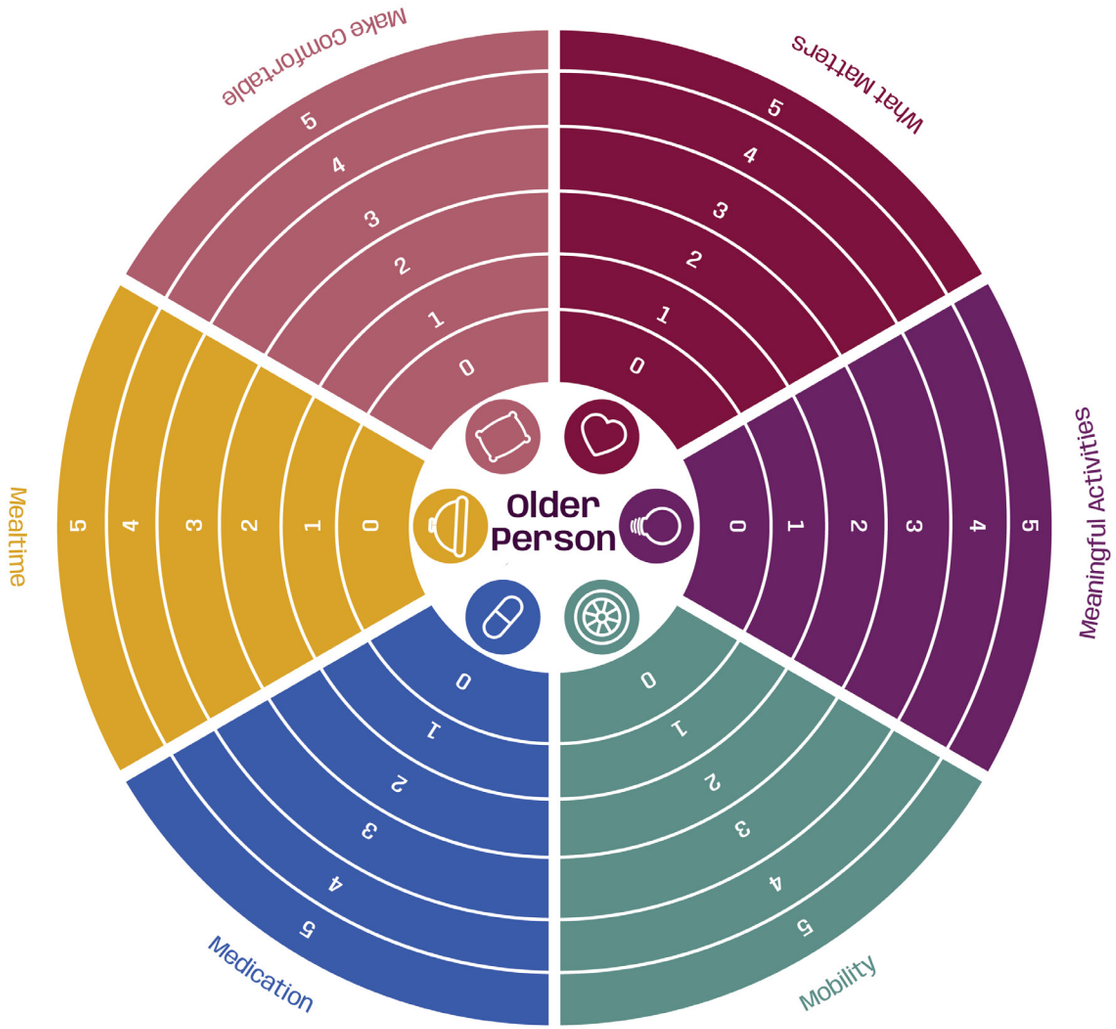
As you review your future design, use the questions under each "M" to reflect:

+ What's working well?

+ What's missing?

+ How might your design evolve to better support aging with dignity, joy, and independence?

6Ms of Care Framework



+ What's working well? + What's missing?
+ How might your design evolve to better support aging with dignity, joy, and independence?

The **6Ms of Care Framework** help us make sure our design ideas consider the whole person, not just one issue. As you look at your future-focused solution, ask yourself: **Does it support real lives, real bodies, and real care experiences?**

You can use the questions below to guide your evaluation even further:

The 6Ms Framework considers:

What Matters – Does this design align with the individual's goals, values, and priorities?

Mobility – Does it support safe, independent movement or reduce barriers to getting around?

Meaningful Activities – Does it help maintain cognitive health, engagement, and social connection?

Medication – Does it support safe medication use, or reduce confusion or harm?

Mealtime – Does it make eating and nutrition easier, enjoyable, or more social?

Make Comfortable – Does it ease pain, provide comfort, or reduce stress?

What Matters

Does your design align with people's personal goals, preferences, and values?

Does this solution reflect what matters most to the person using it?

Does it support independence, dignity, or a sense of purpose?

Is it flexible enough to adapt to changing needs over time?

Mobility

Does your design support safe, independent movement?

Can someone with a mobility aid (walker, cane, wheelchair) use this easily?

Are there barriers—like stairs, tight spaces, or awkward interfaces?

Does the design reduce the effort required to move, reach, or lift?

Meaningful Activities

Does your design support cognitive health, mental stimulation, and connection?

Is it easy to understand and remember how to use it?

Does it help reduce confusion or cognitive overload?

Does it support connection to people, routines, or meaningful activities?

Mealtime

Does your design make eating easier, healthier, or more joyful?

Is it easy to use with limited dexterity or vision?

Does it support nutrition, hydration, or cooking safely at home?

Does it encourage social interaction around food, or reduce isolation?

Medication

If relevant, does your design support medication safety and management?

Could it help remind someone to take medication safely and on time?

Does it reduce the risk of mixing things up or overdosing?

Is it compatible with how older adults actually store and access medications?

(Note: If your design isn't related to health or medication, this may not apply—and that's okay.)

Make Comfortable

Does your design provide physical or emotional comfort?

Does it reduce stress, frustration, or pain?

Is it calming, soothing, or easy to use even on a difficult day?

Does it help someone feel seen, included, or safe?

Remember: not every design will address every "M," and that's okay. What matters is that we ask the right questions—because when we center what matters, reduce barriers, and design with empathy, we're not just creating for older adults—we're creating for all of us, now and in the future.

Design for **Joy**

Provocations for the Future

Provocations based on work published in Matriarchal Design Futures
A. Takase, H. Snyder Quinn, and C. Rosas

AWARENESS

Begin–reflection on the current state:
What assumptions or biases exist in design for older adults?
What's missing in how we currently design for aging?
How do your design choices affect older adults?
Are you considering future needs, including your own?

ACCEPTANCE

Imagine–what are your preferable futures?
How should design support aging?
What kind of experiences do we want for ourselves and others as we age?
What design practices are you already using that align with inclusive, joyful aging?

ACTION

Create–how do we reach our preferable futures?
What immediate actions can you take to design more inclusively?
How can you remove barriers and foster better design for aging?
What needs to shift in your design process or the industry ?
What could we do now?
